child.

2nd Normal Form:

A Relation is in 2nd NF if it is in 1st NF and every non-key attribute is fully functionaly dependant on Primary key. All the non-key attributes must depend on all Parts of primary key. Condition are as following:

1) There Primary key Consist of only one attribute.
2) Every non-key attributes is fully functionality dependant on all the Parts of the Primary key.

Rs

has Composite Primary key consisting of attribute A and B, as the Primary is unique. following dependencies must be true. A,B → C here C is depend on A and B compositly.

Example : let it is in 1st NF

StdID	StdName	Class	FEE	CRSNO	CRSDate
D01	Imran	C01	10,000	CR101	120898
D01	Imran	C01	10,000	CR205	150998
D02	Shahid	C02	10,000	CR207	071098
D03	Zahid	C03	15000	CR201	060499
D03	Zahid	C03	15000	CR205	150998
D04	Shahid	C03	20,000	CR305	12099

Student(StdID, StdName, class, fee, CRSNO, CRSDate)

1- above Relation Contation Composite Primary Key of StdID and CRSNO.

2- The functional dependencies in this relation are following

StdID → StName, class, FE

StdID, CRSNo → CRSDate

* The non-key attributes NAME, class and FEE are functionality dependent on Part of primary key i.e StdID

* StdID is not a complete primary key.

Student → primary

Std-ID	Std-Name	Class	FEE
D01	Imran	C01	10,000
D02	Shahid	C01	10,000
D03	Zahid	C02	15,000
D04	Rashid	C03	12,000

Course

composite.

Std-ID	CRSNO	CRSDate
D01	CR101	120898
D01	CR105	150998
D02	CR 207	071088
D03	CR 201	060498
D03	CR 205	150998
D04	CR 305	120998

The Primary Key in Student relations of only one attribute it statisfies first condition. The attribute CRS DAte in Course Relation fully functionaly depends on whole composite key. it statisfies the third condition. it mean that both relation in second Normal form.)
